Control Recap

- Linear systems: $\dot{x} = Ax + Bu$, $x \in \mathbb{R}^n$
- Linearizing nonlinear systems
 - Jacobians, fixed points
- Eigenvectors/eigenvalues and stability
- Controllability
 - $\text{rank}(\text{ctrb}(A,B)) = n$
 - Reachability
 - Controllability Gramian
 - Pole placement: $\dot{x} = (A - BK_r)x$
 - Linear Quadratic Regulator: $u = -K_r x$
 - *Observability*

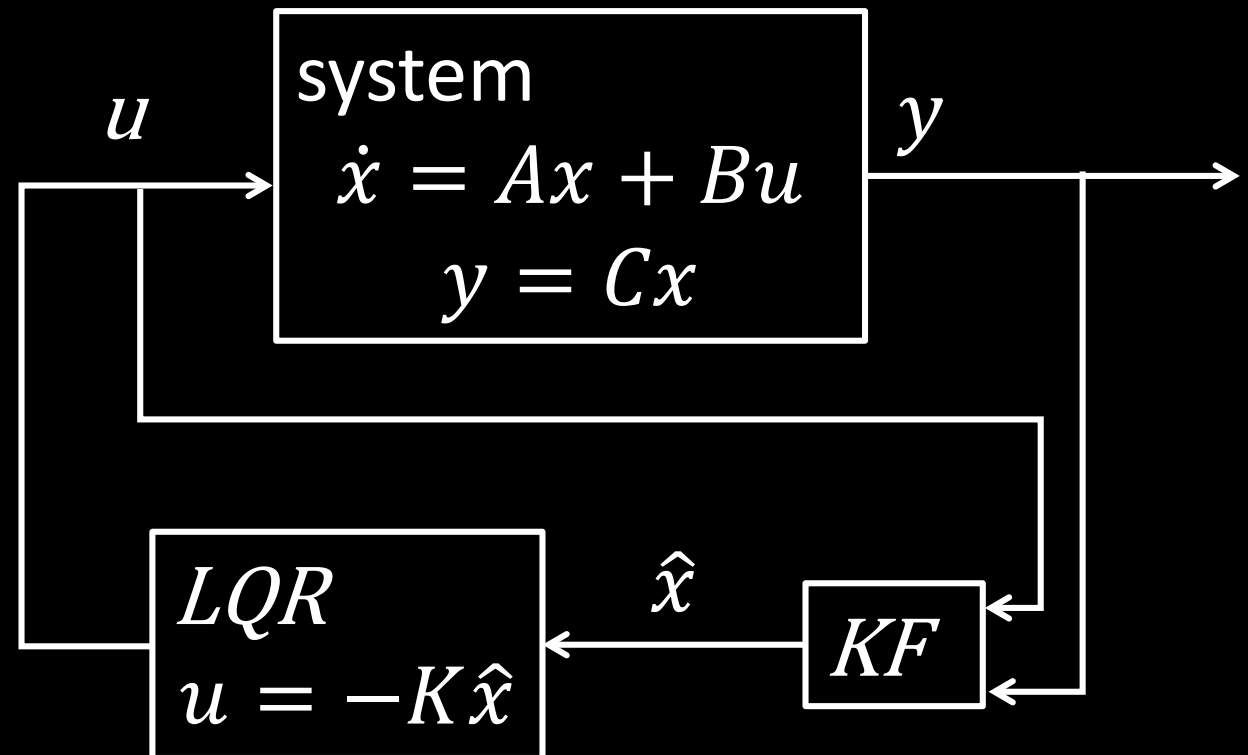

Full State Feedback

- Controllability
 - Can we steer the system anywhere given some control input u ?
- Observability
 - Can we estimate any state x , from a time series of measurements $y(t)$?

$$\dot{x} = Ax + Bu, x \in \mathbb{R}^n$$

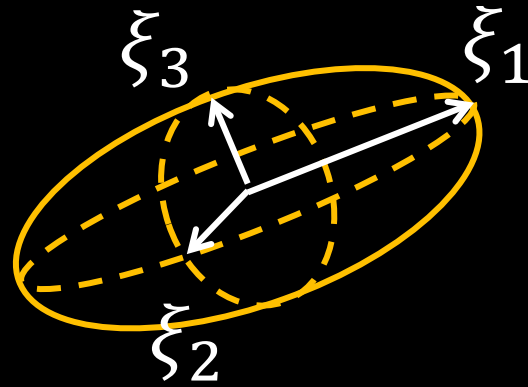

$$u = -Kx$$

$$\dot{x} = (A - BK)x$$

Observability

$$\sigma = \begin{bmatrix} C \\ CA \\ CA^2 \\ \dots \\ CA^{n-1} \end{bmatrix}$$

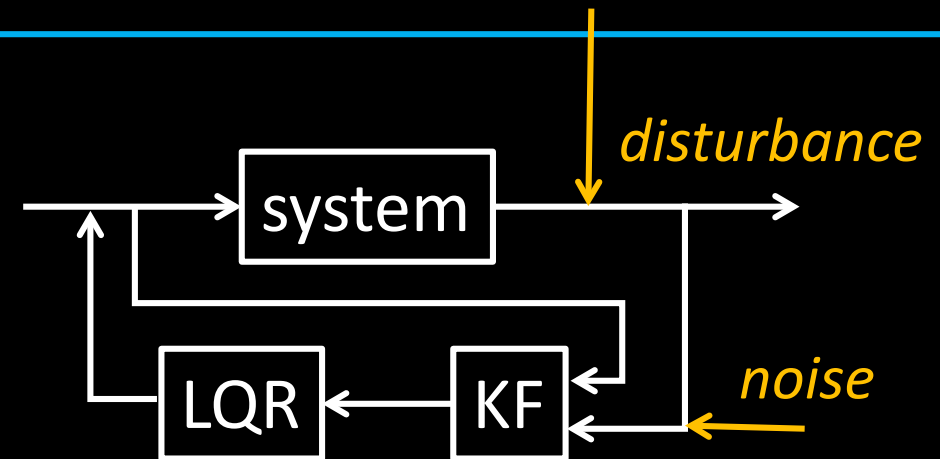

1. Observable iff $\text{rank}(\sigma) = n$
 - $\gg \text{rank}(\text{obsv}(A, C))$
2. Iff a system is observable, we can estimate x from y

- Observability Gramian
 - $\gg [U, \Sigma, V] = \text{svd}(\sigma)$

$$\begin{aligned} \dot{x} &= Ax + Bu + d & x \in \mathbb{R}^n \\ y &= Cx + n & u \in \mathbb{R}^q \\ & & y \in \mathbb{R}^p \end{aligned}$$

- Controllability
- $\mathbb{C} = [B \quad AB \quad A^2B \quad \dots \quad A^{n-1}B]$
- $\gg \text{ctrb}(A, B)$
- Reachability

Bayes Filter – Kalman Filter

- Incorporate uncertainty to get better estimates based on inputs and observations
- Kalman filter is based on the same idea
 - Assume that posterior and prior belief are Gaussian variables

Bayes Filter($\text{bel}(x_{t-1})$, u_t , z_t)

1. for all $x(t)$ do

2. $\overline{\text{bel}}(x(t)) = \sum x(t-1) p(x(t) | u(t), x(t-1)) \text{bel}(x(t-1))$

3. $\text{bel}(x(t)) = \alpha p(z(t) | x(t)) \overline{\text{bel}}(x(t))$

4. end for

5. return $\text{bel}(x_t)$

Bayes Filter – Kalman Filter

- Incorporate uncertainty to get better estimates based on inputs and observations
- Kalman filter is based on the same idea
 - Assume that posterior and prior belief are Gaussian variables
 - Prediction step
 - $x(t) = A x(t-1) + B u(t) + n$, where...
 - $\mu_p(t) = A \mu(t-1) + B u(t)$
 - $\Sigma_p(t) = A \Sigma(t-1) A^T + \Sigma_u$

State estimate: $\mu(t)$
State uncertainty: $\Sigma(t)$
Process noise: Σ_u

Bayes Filter – Kalman Filter

- Incorporate uncertainty to get better estimates based on inputs and observations
- Kalman filter is based on the same idea
 - Assume that posterior and prior belief are Gaussian variables
 - Prediction step
 - $x(t) = A x(t-1) + B u(t) + n$, where...
 - $\mu_p(t) = A \mu(t-1) + B u(t)$
 - $\Sigma_p(t) = A \Sigma(t-1) A^T + \Sigma_u$
 - Update step
 - $K_{KF} = \Sigma_p(t) C^T (C \Sigma_p(t) C^T + \Sigma_z)^{-1}$
 - $\mu(t) = \mu_p(t) + K_{KF} (z(t) - C \mu_p(t))$
 - $\Sigma(t) = (I - K_{KF} C) \Sigma_p(t)$

State estimate: $\mu(t)$
State uncertainty: $\Sigma(t)$
Process noise: Σ_u
Kalman filter gain: K_{KF}
Measurement noise: Σ_z
Observations: $z(t)$

Kalman Filter Implementation

Kalman Filter ($\mu(t-1)$, $\Sigma(t-1)$, $u(t)$, $z(t)$)

1. $\mu_p(t) = A \mu(t-1) + B u(t)$
 2. $\Sigma_p(t) = A \Sigma(t-1) A^T + \Sigma_u$
 3. $K_{KF} = \Sigma_p(t) C^T (C \Sigma_p(t) C^T + \Sigma_z)^{-1}$
 4. $\mu(t) = \mu_p(t) + K_{KF} (z(t) - C \mu_p(t))$
 5. $\Sigma(t) = (I - K_{KF} C) \Sigma_p(t)$
 6. Return $\mu(t)$ and $\Sigma(t)$
- prediction
- update

$$\Sigma_u = \begin{bmatrix} \sigma_1^2 & 0 & 0 \\ 0 & \sigma_2^2 & 0 \\ 0 & 0 & \sigma_3^2 \end{bmatrix}, \Sigma_z = \begin{bmatrix} \sigma_4^2 & 0 \\ 0 & \sigma_5^2 \end{bmatrix}$$

State estimate: $\mu(t)$
State uncertainty: $\Sigma(t)$
Process noise: Σ_u
Kalman filter gain: K_{KF}
Measurement noise: Σ_z
Observations: $z(t)$

Lab 11-12a

- Controllers and Observers
- Real robot
 - Full speed wall-following/turns
 - First order principles and fitting

Lab 11-12b

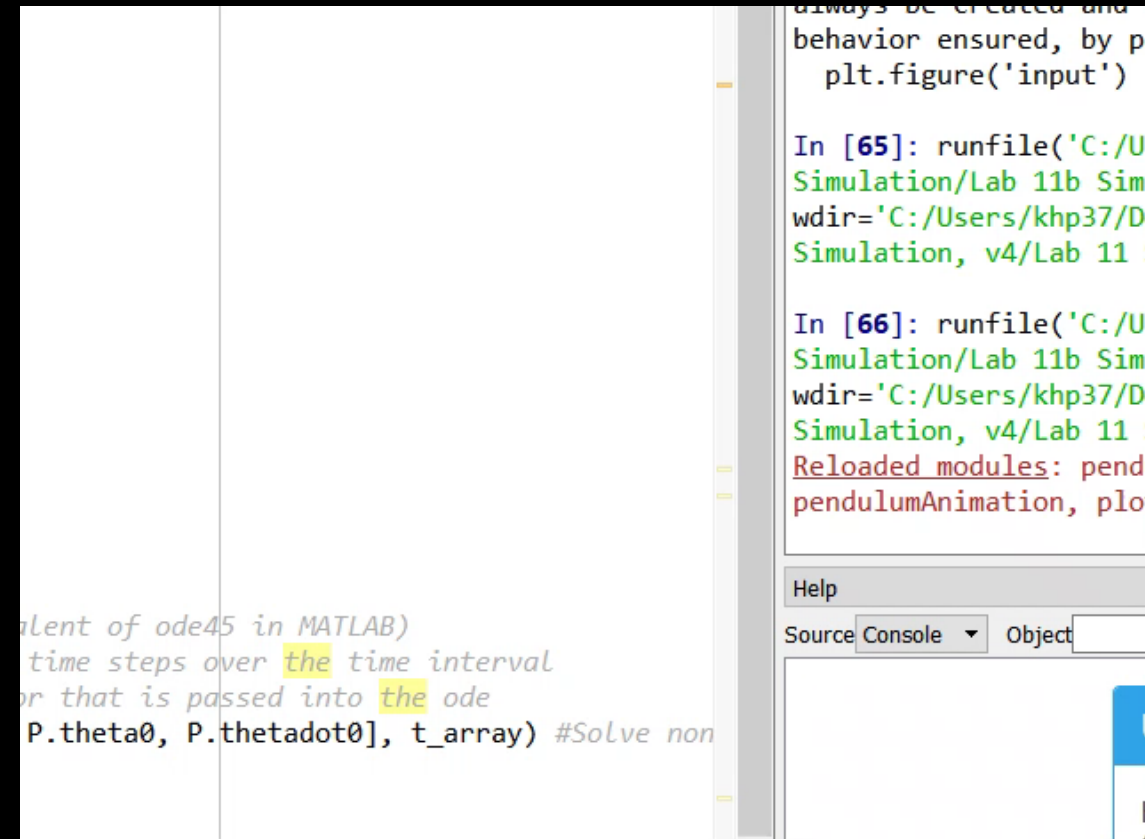

- Controllers and Observers
- Simulation
 - Inverted pendulum on a cart
 - First order principles

Pick one or the other (for both labs)

Lab 11b (and 12b): Inverted pendulum on a cart - *simulation*

- Objectives
 - Implement a controller and an observer
 - How to best use simulations?
 - Quick and safe testing

The screenshot shows a MATLAB console window with the following text:

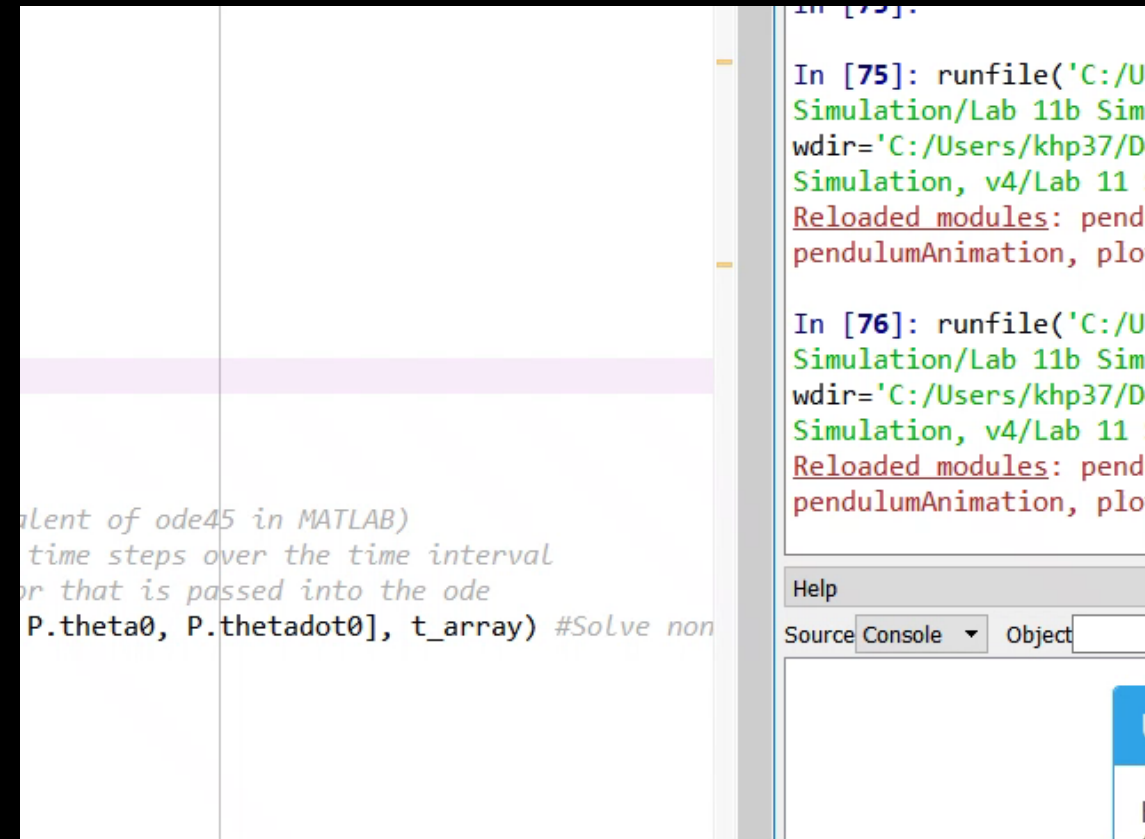

```
always be created and  
behavior ensured, by p

no control

Lab 11b (and 12b): Inverted pendulum on a cart - *simulation*

- Objectives
 - Implement a controller and an observer
 - How to best use simulations?
 - Quick and safe testing
 - Implications of nonlinearities
 - Implications of a poor model
 - Implications of perturbations and sensor noise
 - Feel free to try a real implementation!

The screenshot shows a MATLAB script and its console output. The script includes a comment: "Equivalent of ode45 in MATLAB) time steps over the time interval or that is passed into the ode" and a function call: "P.theta0, P.thetadot0], t_array) #Solve non". The console output shows two execution steps, [75] and [76], both using "runfile" to execute a simulation file. Both steps report "Reloaded modules: pendulumAnimation, plot".

with control and changing z reference

Questions?

Lab 11a (and 12a): Turning a Corner – *real implementation*

- Objective
 - Implement a controller and an observer
- Lab: Full speed navigation along the inner part of a corner

Lab 11a (and 12a): Turning a Corner – *real implementation*

- Objective
 - Implement a controller and an observer
 - Lab: Full speed navigation along the inner part of a corner
 - Lab 11a: LQR control for full speed wall following

Lab 11a (and 12a): Turning a Corner – *real implementation*

- Objective
 - Implement a controller and an observer
 - Lab: Full speed navigation along the inner part of a corner
 - Lab 11a: LQR control for full speed wall following
 - State space
 - Equations of motion
 - Estimate parameters for A and B
 - Estimate and tune Q and R
 - Compute the LQR gain, K_r

Lab 11a (and 12a): Turning a Corner – *real implementation*

- State space

- $\begin{bmatrix} z \\ \theta \end{bmatrix}$

- Small angle approximation

- $\dot{z} = v\theta$

- State space

- $\begin{bmatrix} \dot{z} \\ \dot{\theta} \end{bmatrix} = \begin{bmatrix} 0 & v \\ 0 & 0 \end{bmatrix} \begin{bmatrix} z \\ \theta \end{bmatrix} + \begin{bmatrix} 0 \\ cst \end{bmatrix} u$

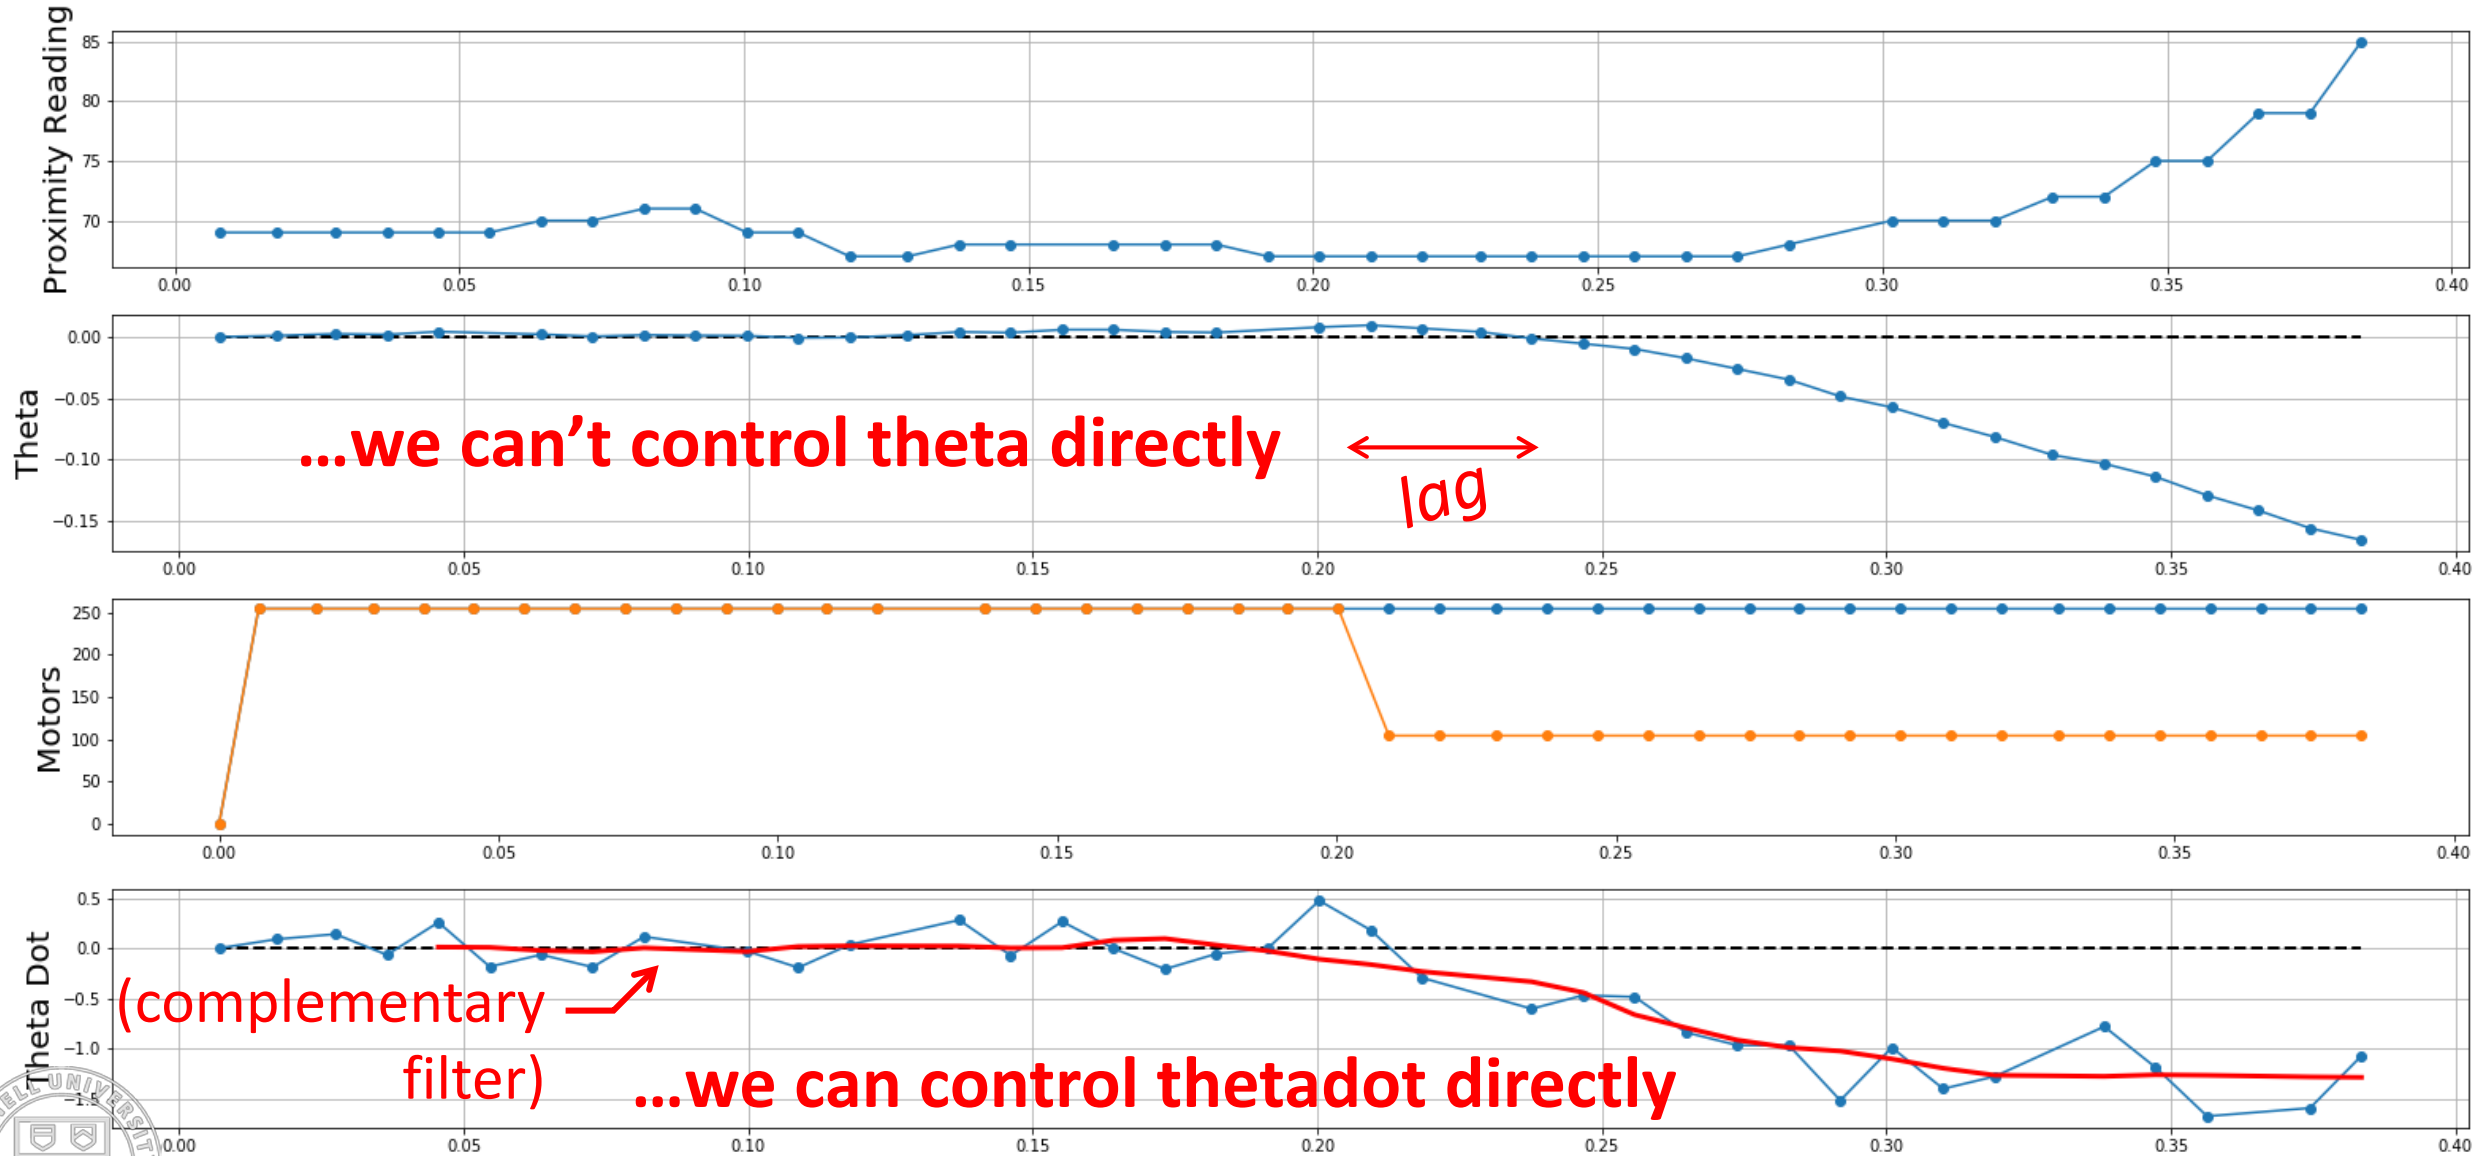

What do we do now?

- Check out the step response

- One motor is always on full power
- Assume $v = \text{max speed [m/s]}$
- Input is a torque

Lab 11a (and 12a): Turning a Corner – *real implementation*

Lab 11a (and 12a): Turning a Corner – *real implementation*

- Basic equation
 - $\tau = I\ddot{\theta}$
- Torque experienced by robot

- $U - d\dot{\theta} = I\ddot{\theta}$

- $\frac{U}{I} - \frac{d}{I}\dot{\theta} = \ddot{\theta}$ *d, I?*

- Steady state

- $\ddot{\theta}_{SS} = 0$

- $\frac{U_{SS}}{I} - \frac{d}{I}\dot{\theta}_{SS} = 0$

- $d = \frac{-U_{SS}}{\dot{\theta}_{SS}}$

Lab 11a (and 12a): Turning a Corner – *real implementation*

Lab 11a (and 12a): Turning a Corner – *real implementation*

- Basic equation
 - $\tau = I\ddot{\theta}$
- Torque experienced by robot

- $U - d\dot{\theta} = I\ddot{\theta}$

- $\frac{U}{I} - \frac{d}{I}\dot{\theta} = \ddot{\theta}$ *d, I?*

- Steady state

- $\ddot{\theta}_{SS} = 0$

- $\frac{U_{SS}}{I} - \frac{d}{I}\dot{\theta}_{SS} = 0$

- $d = \frac{-U_{SS}}{\dot{\theta}_{SS}}$

- Use the 90% rise time to determine I

- Pretend $\dot{\theta} = x$

- $\dot{x} = -\frac{d}{I}x + \frac{U}{I}$

- $\dot{x} + \frac{d}{I}x = \frac{U}{I}$

- $x = 1 - e^{-\frac{d}{I}t_{0.9}}$

- $1 - x = e^{-\frac{d}{I}t_{0.9}}$

- $\ln(1 - x) = -\frac{d}{I}t_{0.9}$

- $I = \frac{-dt_{0.9}}{\ln(0.1)}$

1st order system:

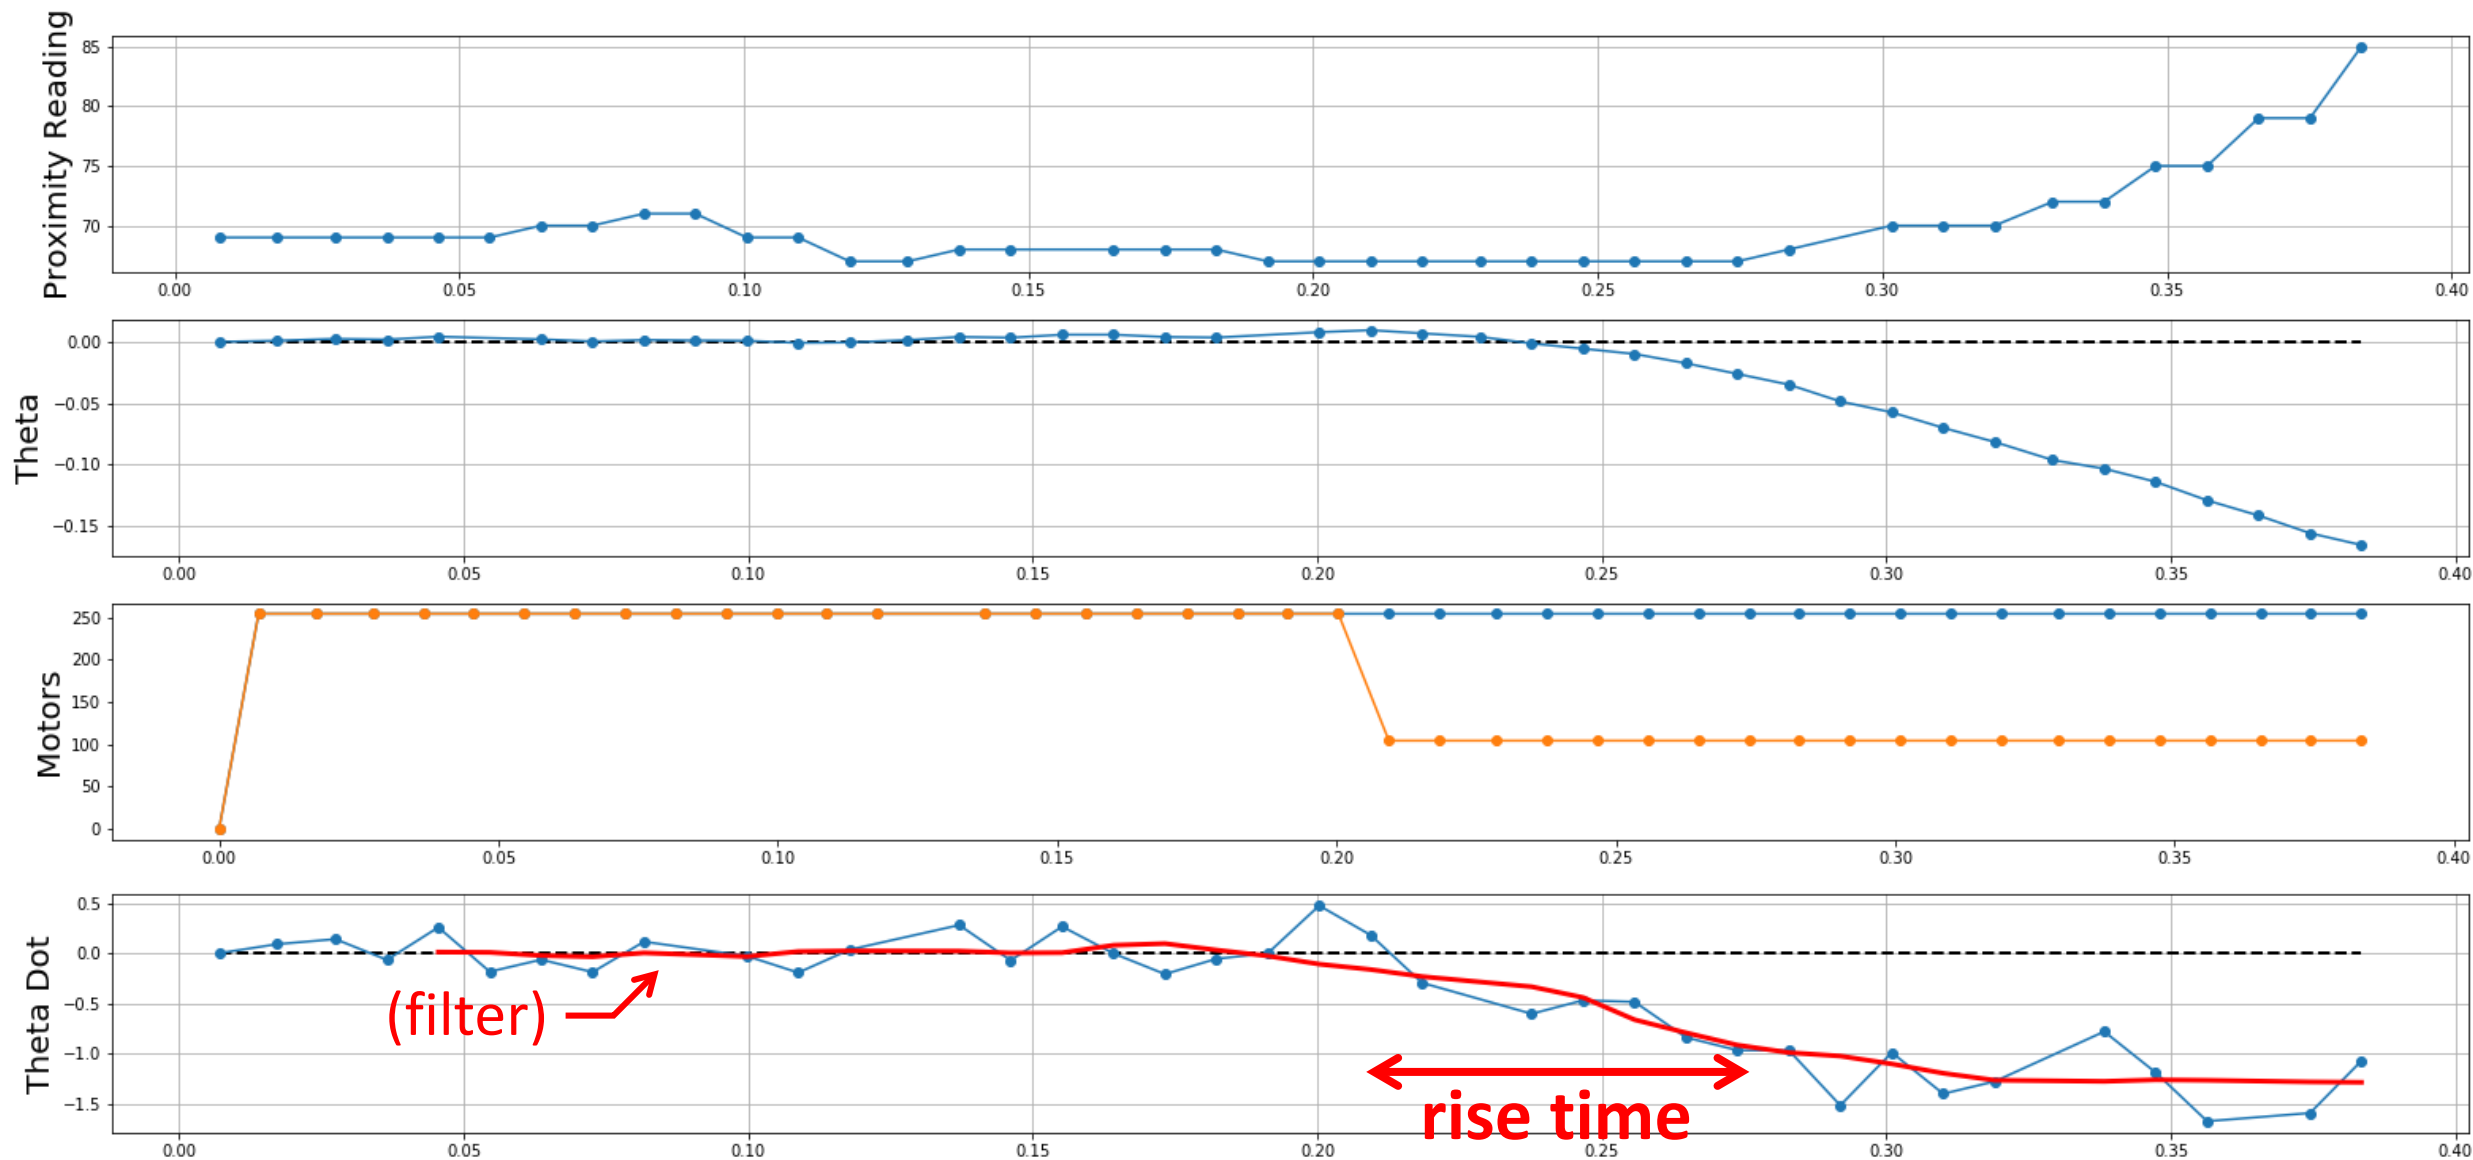

$$\frac{dy(t)}{dt} + \frac{1}{\tau}y(t) = x(t)$$

Step response solution:

$$y(t) = 1 - e^{-\frac{t}{\tau}}$$

Lab 11a (and 12a): Turning a Corner – *real implementation*

Lab 11a (and 12a): Turning a Corner – *real implementation*

- Equations of motion

- $\dot{z} = v\theta$

- $\ddot{\theta} = -\frac{d}{I}\dot{\theta} + \frac{U}{I}$

- Steady state: $d = \frac{-U_{SS}}{\dot{\theta}_{SS}}$

- Rise time: $I = \frac{-dt_{0.9}}{\ln(0.1)}$

- State space

- $\dot{x} = Ax + Bu$

- $$\begin{bmatrix} \dot{z} \\ \dot{\theta} \\ \ddot{\theta} \end{bmatrix} = \begin{bmatrix} 0 & v & 0 \\ 0 & 0 & 1 \\ 0 & 0 & -\frac{d}{I} \end{bmatrix} \begin{bmatrix} z \\ \theta \\ \dot{\theta} \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ \frac{1}{I} \end{bmatrix} U$$

- Now, implement LQR feedback

- Q, R cost functions...

- $Q = \begin{bmatrix} s & 0 & 0 \\ 0 & s & 0 \\ 0 & 0 & s \end{bmatrix}$

- $R = [s]$

Lab 11a (and 12a): Turning a Corner – *real implementation*

Lab 11a (and 12a): Turning a Corner – *real implementation*

- Adjust cost functions
- Keep units in mind
- What if we start at an angle?
- Make controller more aggressive?

Lab 11a (and 12a): Turning a Corner – *real implementation*

- Objective
 - Implement a controller and an observer
- Lab: Full speed navigation along the inner part of a corner
 - Lab 11a: LQR control for full speed wall following
 - State space
 - Equations of motion
 - Estimate A and B parameters
 - Estimate and tune Q and R
 - Compute the LQR gain, K_r
 - Lab 12a: LQG control for full speed wall following and corner turning
 - Compute and implement a Kalman Filter
 - Experiment with turns and drift

Questions?

Next up!
